

HEALTHY PONDS[®]

arbourdale[™]

Pond Dye

- Blocks sunlight to help prevent algae and rooted weed growth
- Use from thaw to freeze
- All ponds will benefit from the addition of dye, but in shallower ponds (<10' deep), dye is strongly recommended

Algae Armour

- Traps phosphates to help control algae, duckweed, and other unwanted aquatic weeds
- Apply when water temperature reaches 7 degrees Celsius
- Duckweed and cattails are indicators of high phosphate levels; if observed, Algae Armour treatment is recommended 3 days before bacteria application

HEALTHY PONDS[®]

arbourdale[™]

Blast

- Instantly available bacteria used in conjunction with AquaSpheres
- Acts like a "shock," immediately releasing bacteria to break down decomposing organic material
- Ponds with known organics, odour, or weed problems use Blast with the first AquaSphere application of the season. Any pond may require a Blast application in the event of nutrient influx (heavy rain) or an algal bloom

AquaSphere

- Time-released bacterial treatment used to break down decomposing organic material, starving weeds of vital nutrients
- Will help remedy weed growth, clarity issues, and odour
- Apply every 30 days while water temperature remains above 7 degrees Celsius
- Use in any pond with decomposing organic material or unwanted aquatic weed growth
